

The diagram illustrates a cable-stayed bridge. A central pylon is shown with a cable running vertically through its center. This cable branches out into two main cables that run parallel to the bridge deck. These main cables are supported by a series of smaller cables that connect them to the bridge deck. The bridge deck is shown as a horizontal line with a central section and two side sections. The side sections are supported by the main cables, while the central section is supported by the smaller cables. The bridge deck is shown with a central section and two side sections. The side sections are supported by the main cables, while the central section is supported by the smaller cables.
